Getting started with OpenDocViewer

OpenDocViewer (ODV) is the window where you read documents when you open them from your organization's portal or archive system. This guide shows what you need day to day: finding the right page, zooming, and printing. It takes a few minutes to read.

Want to do more – select pages, compare two pages, or see every keyboard shortcut? Three more guides cover that, and you can expand them at the bottom of this page. The pictures show a made-up test document with no real data. The screenshots show the Swedish interface; choose *English* in the **Language** menu to get the button names used in this guide. Click an image to see it larger – click again to close. Download the guide as PDF.

---

1. What it looks like

ODV has three parts: the **toolbar** at the top, the **thumbnail pane** on the left and the **document** in the middle. The page you are looking at has a blue frame.

Overview. Toolbar at the top, thumbnails on the left, document in the middle.

Three words you will see again: a **document** is a file with one or more pages. A **session** is all the documents you opened together from the portal or archive system. The thumbnails are grouped by document (*DOK 1*, *DOK 2* … in the Swedish interface).

<details>
<summary>Back to the portal</summary>

ODV is opened from another system – a portal, an archive or a business application. You get back there with that system's own buttons or by closing the ODV tab. What it looks like depends on your organization.
</details>

2. Wait until everything has loaded

When you have opened the documents, ODV fetches the pages. Meanwhile the page counter is striped and the print and selection buttons are grey. When the stripes disappear, everything is ready.

Loading. Striped page counter, grey buttons – wait.

Ready. The page counter is calm and every button can be used.

▾ **Why is the light by the print button off?**

The small light by the print button belongs to a quick-print feature that your organization may have turned off. If it is off, that is normal. The light on the *help button* to the right, on the other hand, shows how ODV is doing: green is good, yellow means the computer is low on memory, red means an error.

---

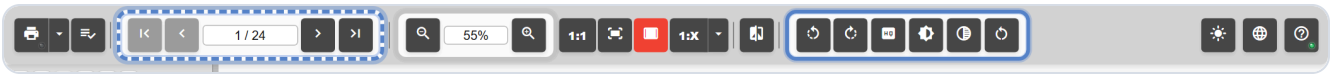

3. Find the right page

There are four simple ways, and you can mix them as you like.

1. **The arrow buttons** in the toolbar: first, previous, next and last page.
2. **Type the page number** in the box between the arrows and press `Enter`.
3. **Click a thumbnail** in the left pane.
4. **Scroll with the mouse wheel.** When you reach the bottom edge of the page and keep scrolling, a small gauge fills up – and the next page is shown. The same works upwards.

<details>
<summary>More ways to browse</summary>

- `Arrow Down` / `Arrow Up` or `Page Down` / `Page Up` change page. Hold the key down to browse quickly.
- `Home` and `End` go to the first and last page.
- Hold down the *previous* or *next* button in the toolbar to browse quickly.
- Hold `Ctrl` and the arrow buttons jump a whole *document* instead of one page. You can tell because the page navigation gets a dashed frame.

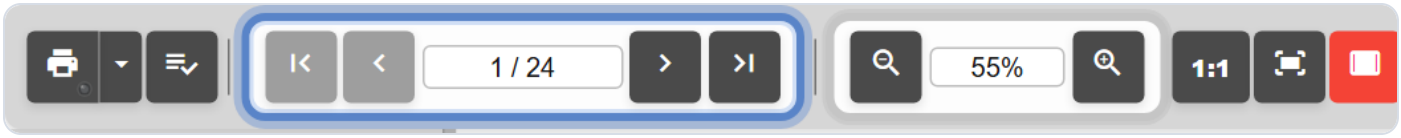

Ctrl held down. Dashed frame = the arrows change document, not page.
</details>

---

4. Zoom and fit

The zoom buttons are in the middle of the toolbar.

- **The magnifying glasses** (*Zoom out*, *Zoom in*) zoom out and in. You can also type a percentage in the box between them.
- **1:1** shows the page at its actual size.
- **Fit to screen** shows the whole page at once.
- **Fit to width** fills the width – it suits most documents. The button is red when it is selected.

The left part of the toolbar. From the left: print, selection, page navigation, zoom out/in, 1:1, fit to screen and fit to width (red = selected).

▾ **More ways to zoom**

- + and - on the keyboard zoom in and out.
- The **1:X** button shows the page at a size you have chosen yourself, and **HQ** makes a PDF page even sharper. Both are described in the guide More features at the bottom of the page.

---

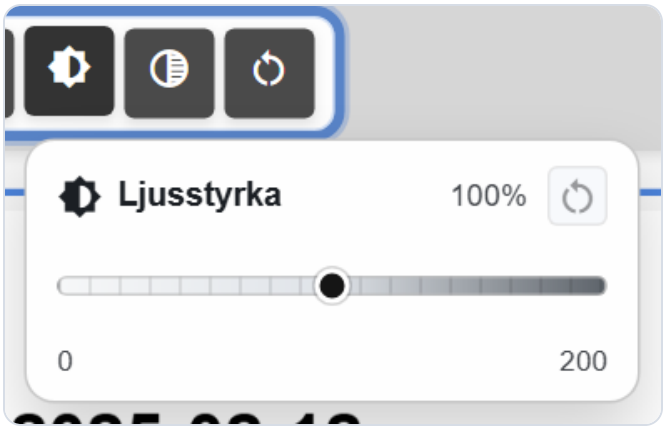

5. Rotate, lighter or darker

Is the page sideways, or is a scanned page too dark or too faint? The buttons on the right of the toolbar help you.

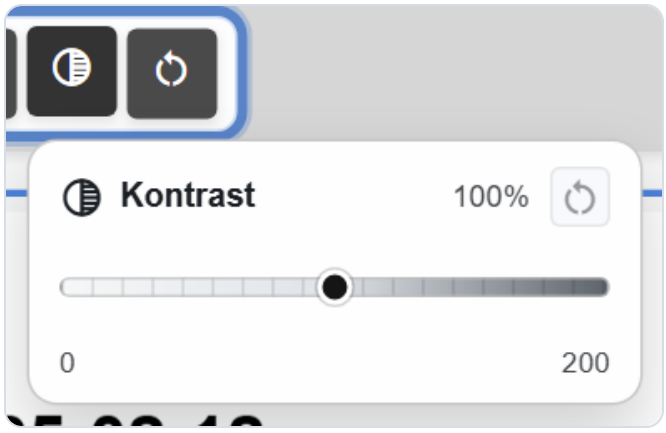

- **Rotate left 90°** and **Rotate right 90°** turn the page a quarter turn.
- **Brightness** and **Contrast** each open a slider. Drag it, or click on the scale.
- **Reset adjustments**, next to the sliders, brings brightness and contrast back to normal.

The right part of the toolbar. Rotate left/right, brightness, contrast and reset.

Brightness.

Contrast.

The changes are temporary. Rotation, brightness and contrast only change how the page is shown to you right now. Nothing is saved in the archive, and the next time the document is opened it looks as usual again.

On the printout the changes are included *only* if you choose the print method **Active page** – both when you are looking at one page and when you compare two. Every other print method (All pages, Simple range, Custom pages and printing a selection) prints the pages as they are in the archive, without your changes.

▾ **Rotate with the keyboard**

`Ctrl` + `Arrow Left` and `Ctrl` + `Arrow Right` rotate the page a quarter turn, just like the buttons.

---

6. The thumbnail pane

The pane on the left shows every page as a small picture, grouped by document. Click a thumbnail to go there. The buttons at the top of the pane make it wider or narrower, and the crossed-out eye hides it completely.

The pane buttons. The arrows change the width, the middle button resets it, the eye hides the pane.

Every thumbnail has small badges in its corners (the letters come from the Swedish interface):

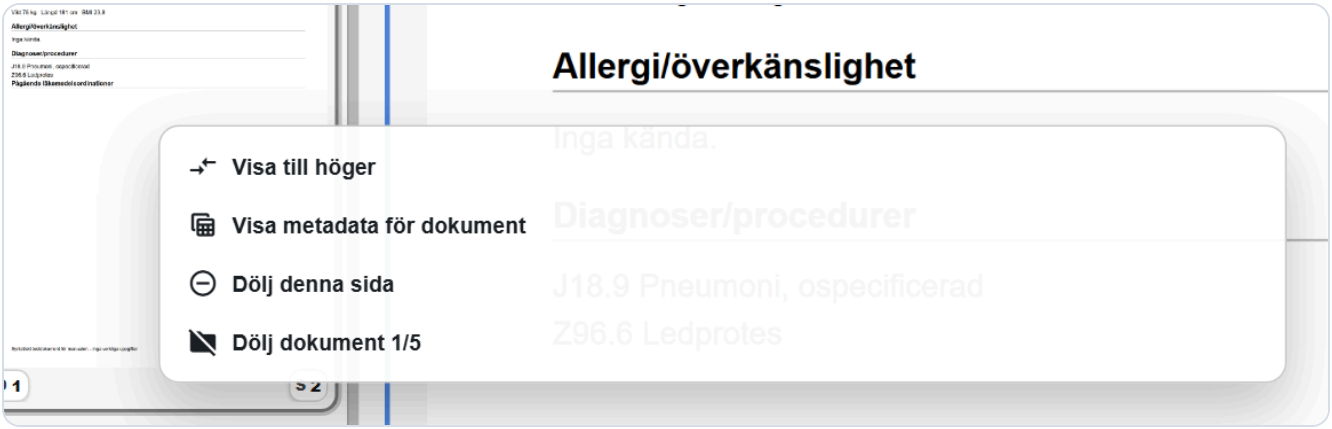

T – the page's place in the whole session

D – the document number

S – the page number within the document

▾ Right-clicking a thumbnail

Right-click a thumbnail to get a small menu: show the document's *metadata* (for example ID, department and date – which fields exist depends on the system that opened the documents), *hide* the page or the whole document, or show the page on the right in compare mode (see the guide Compare two pages). Hiding pages is called *selection* and has its own guide: Selection – choose the pages that are shown and printed.

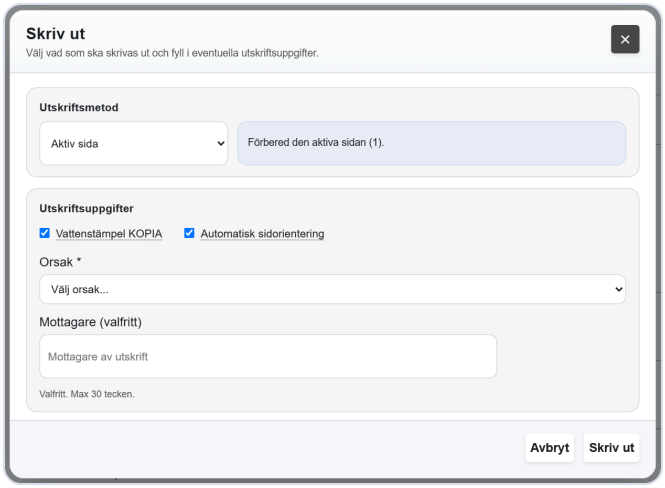

The right-click menu.

---

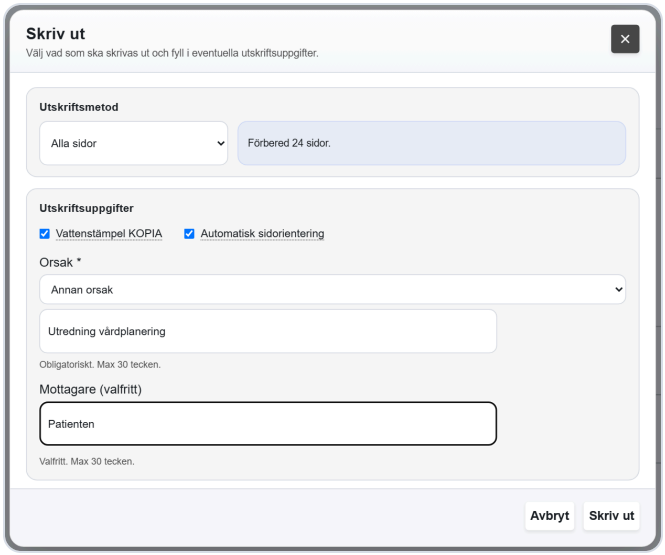

7. Printing

This is how you print the page you are looking at, or all pages.

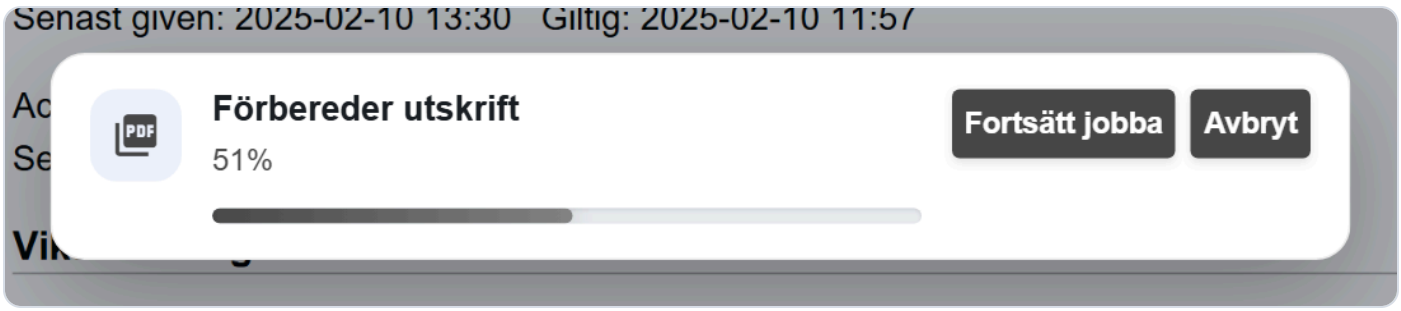

1. Click the **print button** at the far left of the toolbar (or press `Ctrl` + `P`).
2. Choose **Active page** or **All pages** under *Print method*. Have you rotated the page or changed brightness and contrast? Then only *Active page* puts that on paper.
3. Fill in **Reason** and *Recipient* if the dialog asks for them. Your organization decides which fields exist and which are required.
4. If the **Add copy watermark** option is there, leave it ticked if the printout is not an original.
5. Click **Print**. ODV prepares the pages and then opens the browser's print window, where you choose a printer as usual.

The print dialog. Method at the top, then the details.

Print details. Here: reason and recipient. The fields may look different for you.

Preparing print. Wait until it is done – the print window opens by itself. *Cancel* stops it.

Active page prints the page exactly as you see it – with rotation, brightness and contrast if you changed them. **All pages** and the other methods print the pages as they are in the archive, without such changes.

The printout can automatically get a header and a footer with information your organization has chosen – for example date, user, document ID, reason and page number – and a watermark if you left it ticked.

Utskrivningsrapport för perioden 2025-02-09 – 2025-02-12 Sida 1 av 4

KOPIA

Syntetiskt testdokument för manualen – inga verkliga uppgifter

Example of a printout. Header, footer and watermark are set up by your organization.

▾ **More print options**

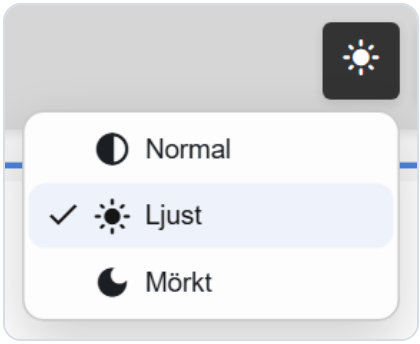

- **The arrow next to the print button** decides whether the dialog opens with *Active page* or *All pages* preselected. ODV remembers your choice.
- **Simple range** prints from one page to another, for example 2–10. **Custom pages** takes a list, for example *1-3, 7, 9-5*. The order you type is the order they are printed in.
- **Automatic page orientation** lets ODV choose portrait or landscape per page. Untick it if everything should be portrait.
- **Continue working** moves the preparation box to the bottom so you can keep reading. When it is ready, click *Open print*.
- After your first printout, the **Reuse latest print settings** button appears at the top right of the dialog. It fills in the same choices as last time.
- Want to print only some pages from several documents? Then make a *selection* first – see the guide Selection at the bottom of the page.

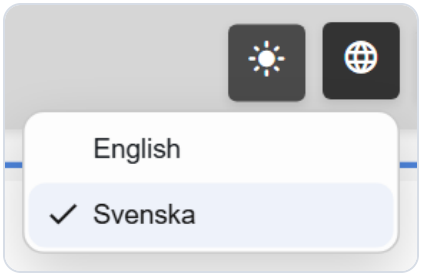

The arrow next to the print button. Sets the default.

8. Theme, language and help

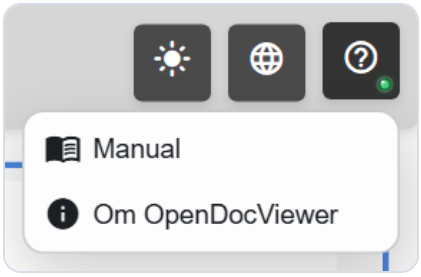

At the far right of the toolbar there are three menus. **Theme** chooses a light or dark look, **Language** switches between Swedish and English, and **Help** opens this guide. ODV remembers your choices until next time.

Theme.

Language.

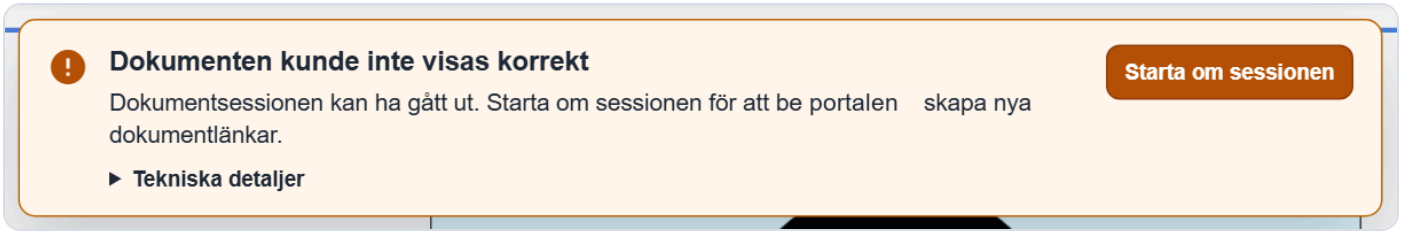

Help. The guide and *About OpenDocViewer*.

---

9. If something goes wrong

The pages are shown as warning triangles

The document links from the portal or archive system may be valid for a limited time. If you have had ODV open for a long time, the pages may stop showing and a box appears at the top. Click **Reset session** and the documents are fetched again. You do not need to reload the browser.

Click Reset session.

Other common situations

- **The print button is grey.** The pages are still loading – wait until the page counter is no longer striped.
- **Pages are missing from the thumbnail pane.** A selection is active (the selection button in the toolbar is red). Click the red button at the top of the pane to show all pages again.
- **The page is blurry.** If it is a PDF page, the **HQ** button can make it sharper. Scanned pages are already shown as sharp as they are.

▾ **If you need to contact support**

Contact your local support, as usual in your organization. Open the help menu and choose *About OpenDocViewer*. It shows the version, and under *Diagnostics* you can download a file to attach to the ticket. The file contains technical information about ODV – no documents. If the expired-session box is shown, you can expand *Technical details* there too. More about this in More features.

---

10. Want to know more?

That was the everyday part. Three more guides cover the rest. Expand them below – they open on this page – or download them as separate documents.

Selection – as PDF

Choose the pages that are shown and printed. Opens as a separate document.

Compare two pages – as PDF

Side by side, fine tuning, overlay, curtain and printing. Opens as a separate document.

More features – as PDF

Metadata, sharper PDF pages, keyboard shortcuts and more. Opens as a separate document.

Short checklist

- ✓ Wait until the page counter is no longer striped before you print.
- ✓ Check the reason and the scope in the print dialog before you click Print.
- ✓ If you get the expired-session box: click *Reset session*.

This guide covers OpenDocViewer 2.10. Your organization may have set up some features differently. Updated 2026-10-24.
