Selection – choose the pages that are shown and printed

With a **selection** you decide which pages OpenDocViewer (ODV) shows and prints. You start from all pages and remove the ones you do not need. That is handy when a session contains many documents but you only want a few pages.

This guide belongs with Getting started with OpenDocViewer. The pictures show a made-up test document in the Swedish interface; the button names in the text are the English ones. Download the guide as PDF.

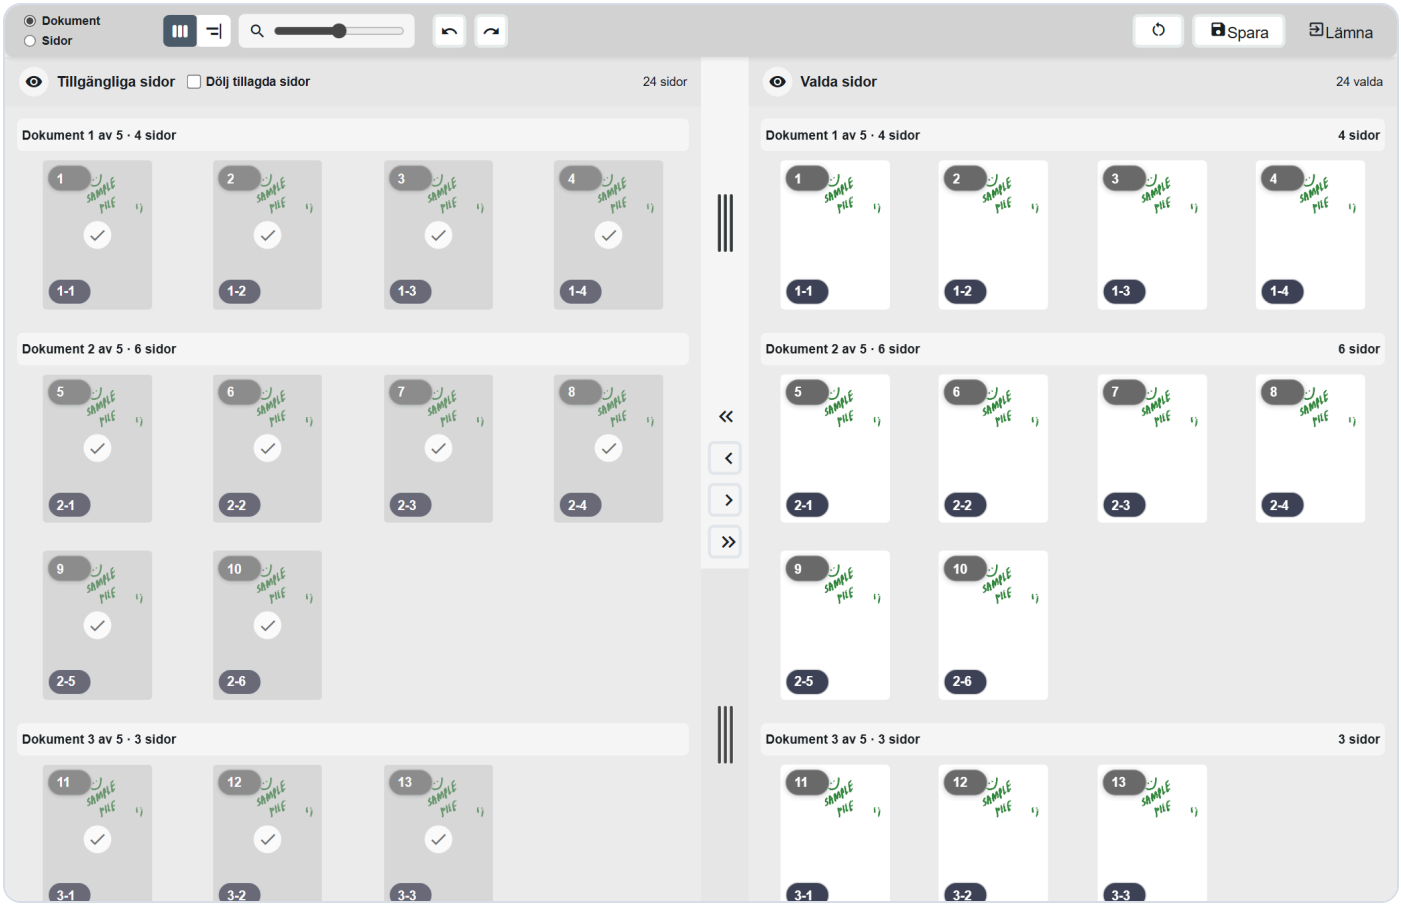

Important: a selection hides pages in ODV and controls what is printed. The original documents in the archive are never affected. The selection is not kept: when you load new documents, all pages are shown again.

1. Open the selection workspace
2. Remove pages from the selection
3. Add pages back to the selection
4. Change the order
5. Preview a page in the workspace
6. Save the selection or leave the workspace
7. How to tell that a selection is active
8. Print the selection
9. Remove the selection

1. Open the selection workspace

Click the **selection button** in the toolbar – the one with a list and a check mark, directly to the right of the print button. Its tooltip says *Manage the pages shown and printed*. The workspace opens over the whole window.

The button is gray until all pages have loaded. The tooltip then says *Selection management is available when all pages are fully loaded.*

The workspace. On the left, *Available pages* – every page in the session. On the right, *Selected pages* – the pages in the selection, in the order they are shown and printed. A check mark on a page on the left means it is already included.

The workspace toolbar. From the left: mode (*Documents* or *Pages*), panel layout, thumbnail size, *Undo* and *Redo*. On the right: the button that discards unsaved changes, *Save* and *Leave*.

Two modes. At the top left you choose how pages may be moved:

- **Documents** keeps the pages of each document together. You can remove and add pages and move them within their own document. This mode is preselected when the system you came from supplied details about the documents. Otherwise the option is gray and only *Pages* is available.
- **Pages** drops the grouping. You can then mix pages from different documents in any order you like, for example before printing.

▾ **More buttons and controls in the workspace**

- **Panel layout**: *Show both panels*, or *Show selected pages*, which shows only the right panel.
- **Thumbnail size**: the slider makes the pages in the panels larger or smaller, from 70 to 320 %.
- **Hide added pages** in the left panel hides the pages that are already included, so you only see the ones still left to add. The counter then shows how many remain.
- The **eye** in a panel header previews that panel's pages from the first one (see *Preview a page in the workspace*).
- Drag the **divider** between the panels to change their width.
- The `Esc` key does the same as **Leave**.

▾ **For whoever manages the installation: the button may be switched off**

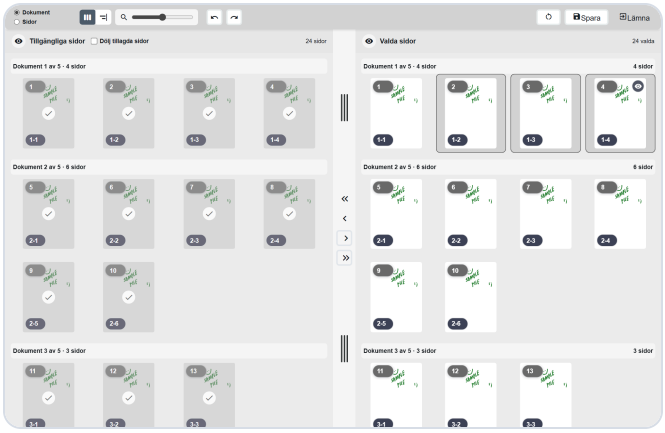

The workspace is switched off with `print.selectionWorkspace.enabled` in `odv.site.config.js`. There is then no selection button in the toolbar, but the right-click menu and the `Delete` key (see *Remove pages from the selection*) still work.

---

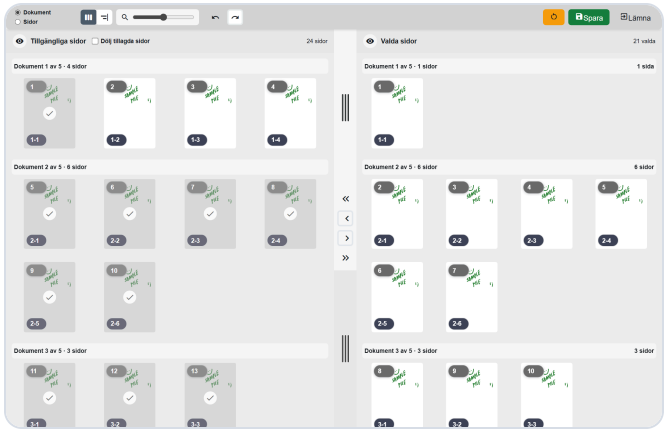

2. Remove pages from the selection

1. **Click a page in the right panel** that should not be included – it gets a dark frame, and the buttons call it *selected*. Hold `Ctrl` and click to highlight more pages, or hold `Shift` and click to highlight every page between two clicks.
2. Click **Remove selected** – the arrow ‹ between the panels. The pages disappear from the right panel and lose their check mark on the left.

Would you rather start from scratch? Click **Remove all** (*«*) to empty the right panel.

Highlighted pages. Three pages in document 1 have a dark frame. The eye on the page under the mouse pointer opens the preview.

After Remove selected. Document 1 has one page left and the counter shows *21 selected*. The pages on the left have lost their check mark, *Save* has turned green and *Undo* can be clicked.

▾ More ways to highlight: Shift, Ctrl, rectangle, double-click

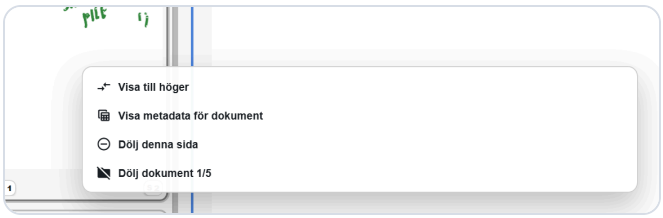

- `Shift` +click highlights every page between two clicks. `Ctrl` +click adds a single page to the highlighted set or removes it from the set.
- Drag a **rectangle** over an empty area of the panel to highlight the pages inside it. Hold `Ctrl` to add them to what you have already highlighted.
- **Double-click** a page: in the right panel it is removed, in the left panel it is added – if the page is already included (gray, with a check mark) it is removed instead.
- Click a **document header** to highlight the whole document. Double-click the header to remove the whole document (right panel) or add it (left panel; if the whole document is already included it is removed).
- You can also **drag** pages from one panel to the other.

▾ Hide pages straight from the document: right-click or Delete

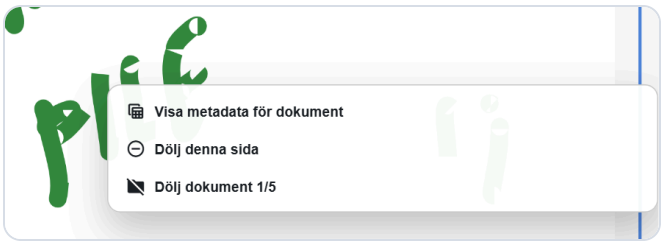

For single pages you do not need to open the workspace at all:

- **Right-click** a thumbnail or the page in the middle and choose **Hide this page** or **Hide document 1/5**. The numbers are the document's number and the number of documents in the session.
- Press `Delete` to hide the page you are looking at, or `Ctrl` + `Delete` for the whole document.

The pages disappear at once, without saving. The options appear only when all pages have loaded.

Right-clicking a thumbnail. The last two options hide the page or the whole document. *Show to right* belongs to the guide Compare two pages.

Right-clicking the page in the middle. The same options for hiding the page or the document.

---

3. Add pages back to the selection

1. Click a page without a check mark in the **left** panel – pages without a check mark are not included. Hold `Ctrl` and click to highlight more pages, or hold `Shift` and click to highlight every page between two clicks.
2. Click **Add selected** (›). The pages get their check mark back and appear in the right panel – in *Documents* mode at their place in the document.

You can also add a page back by double-clicking it on the left or dragging it to the right panel. Want everything back? Click **Add all** (»).

Undo in the toolbar reverses your latest change, and **Redo** applies it again. Only the latest change can be undone, not several in a row. To go back to the last saved selection, use the orange button to the left of *Save* (see *Save the selection or leave the workspace*).

4. Change the order

Drag a page in the right panel to a new place. A marker shows where it will land when you let go.

- In *Documents* mode you move pages within their own document. Drag the document header to move the whole document. A page that is no longer in its original order gets an orange frame. Hover over it and it says *This page is out of the original order within its document*.
- In *Pages* mode you mix freely, even across documents.

The order in the right panel becomes the order in ODV and on the printout. The number at the top left of each page in the right panel is the page's place in the printout.

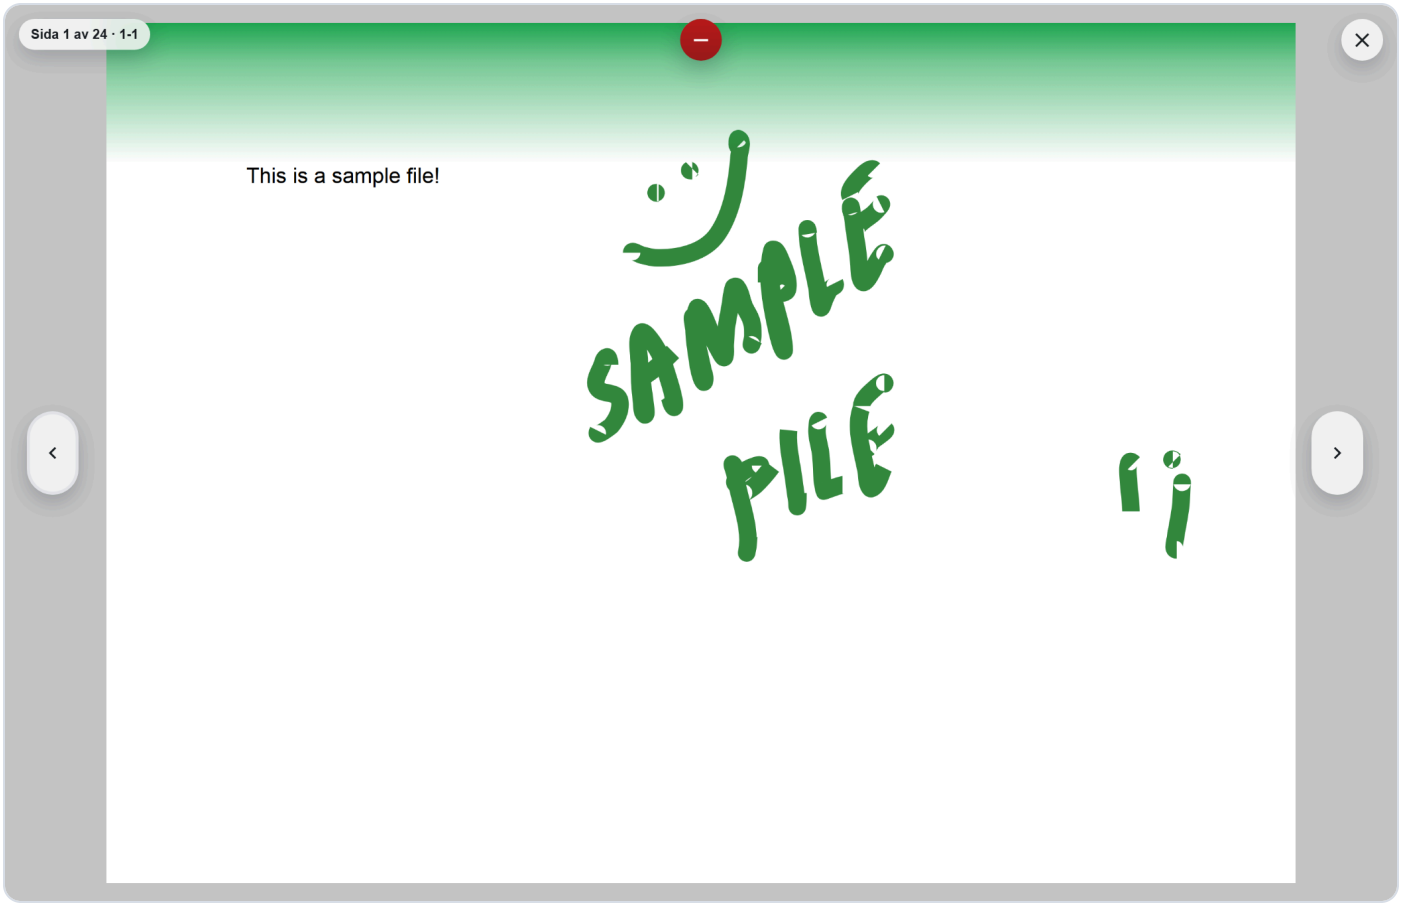

If you switch to *Documents* while the order crosses document boundaries, ODV asks whether you want to restore the original document and page order.

5. Preview a page in the workspace

Hover over a page and click the **eye** (*Show page*). The page is shown at full size.

- A **green band** at the top means the page is in the selection, a **red band** that it is not.
- The button in the band adds (+) or removes (−) the page directly. `Space` does the same.
- The arrows at the edges, or the arrow keys, step to the next page in the same panel.
- `Esc` or the cross at the top right closes the preview.

The eye in a panel header (*Preview selected pages from the first page*; on the left *Preview available pages from the first page*) opens the preview on the panel's first page, so you can page through the whole panel.

Preview. The band is green, so the page is in the selection. The − button removes it. At the top left you see the page's number in the session and its place in the document.

---

6. Save the selection or leave the workspace

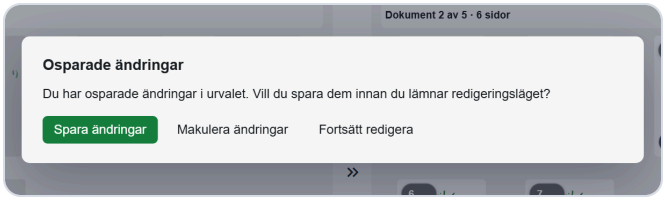

1. Click **Save**. The button is green while you have unsaved changes, and white with a thin frame when there is nothing to save.
2. Click **Leave**. You return to the document with the selection active.

If you leave without saving, the *Unsaved changes* dialog appears with three choices: **Save changes**, **Discard changes** and **Continue editing**.

The orange button to the left of *Save* discards your unsaved changes and goes back to the last saved selection. The right panel must contain at least one page before you can save.

The toolbar with unsaved changes. The green *Save* saves, the orange button discards the changes.

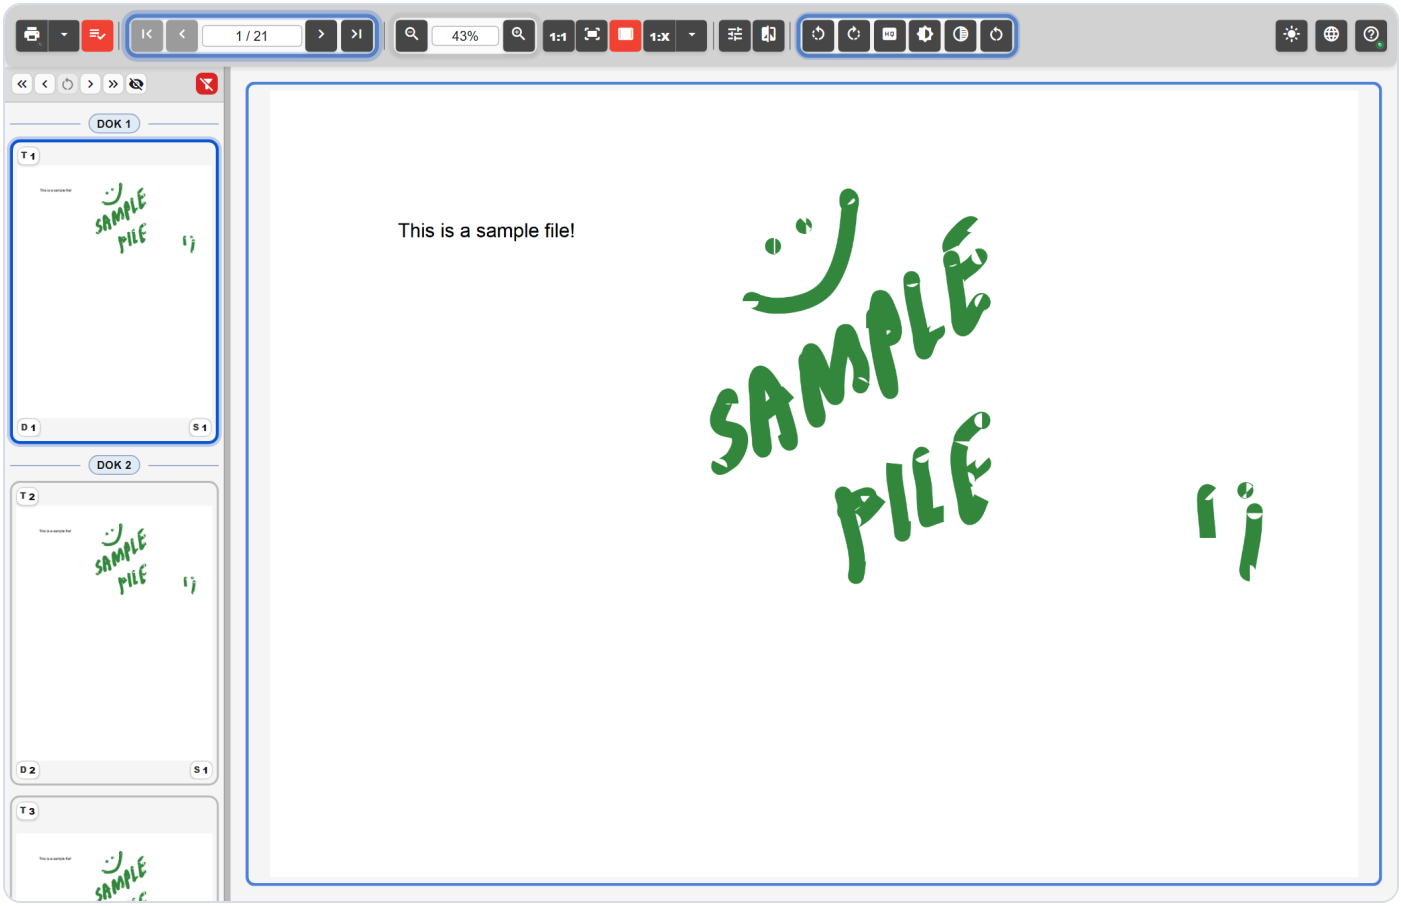

The Unsaved changes dialog. Shown when you click *Leave* or press `Esc` without having saved.

---

7. How to tell that a selection is active

Back in the document, the selection shows in three places:

- The **selection button** in the toolbar is red.
- The **page box** in the toolbar counts only the pages in the selection, for example *1 / 21*. The *T* badge on the thumbnails shows the page's number in the selection.
- The **thumbnail pane** shows only the pages that are included. At the top of the pane there is a **red button** that removes the selection.

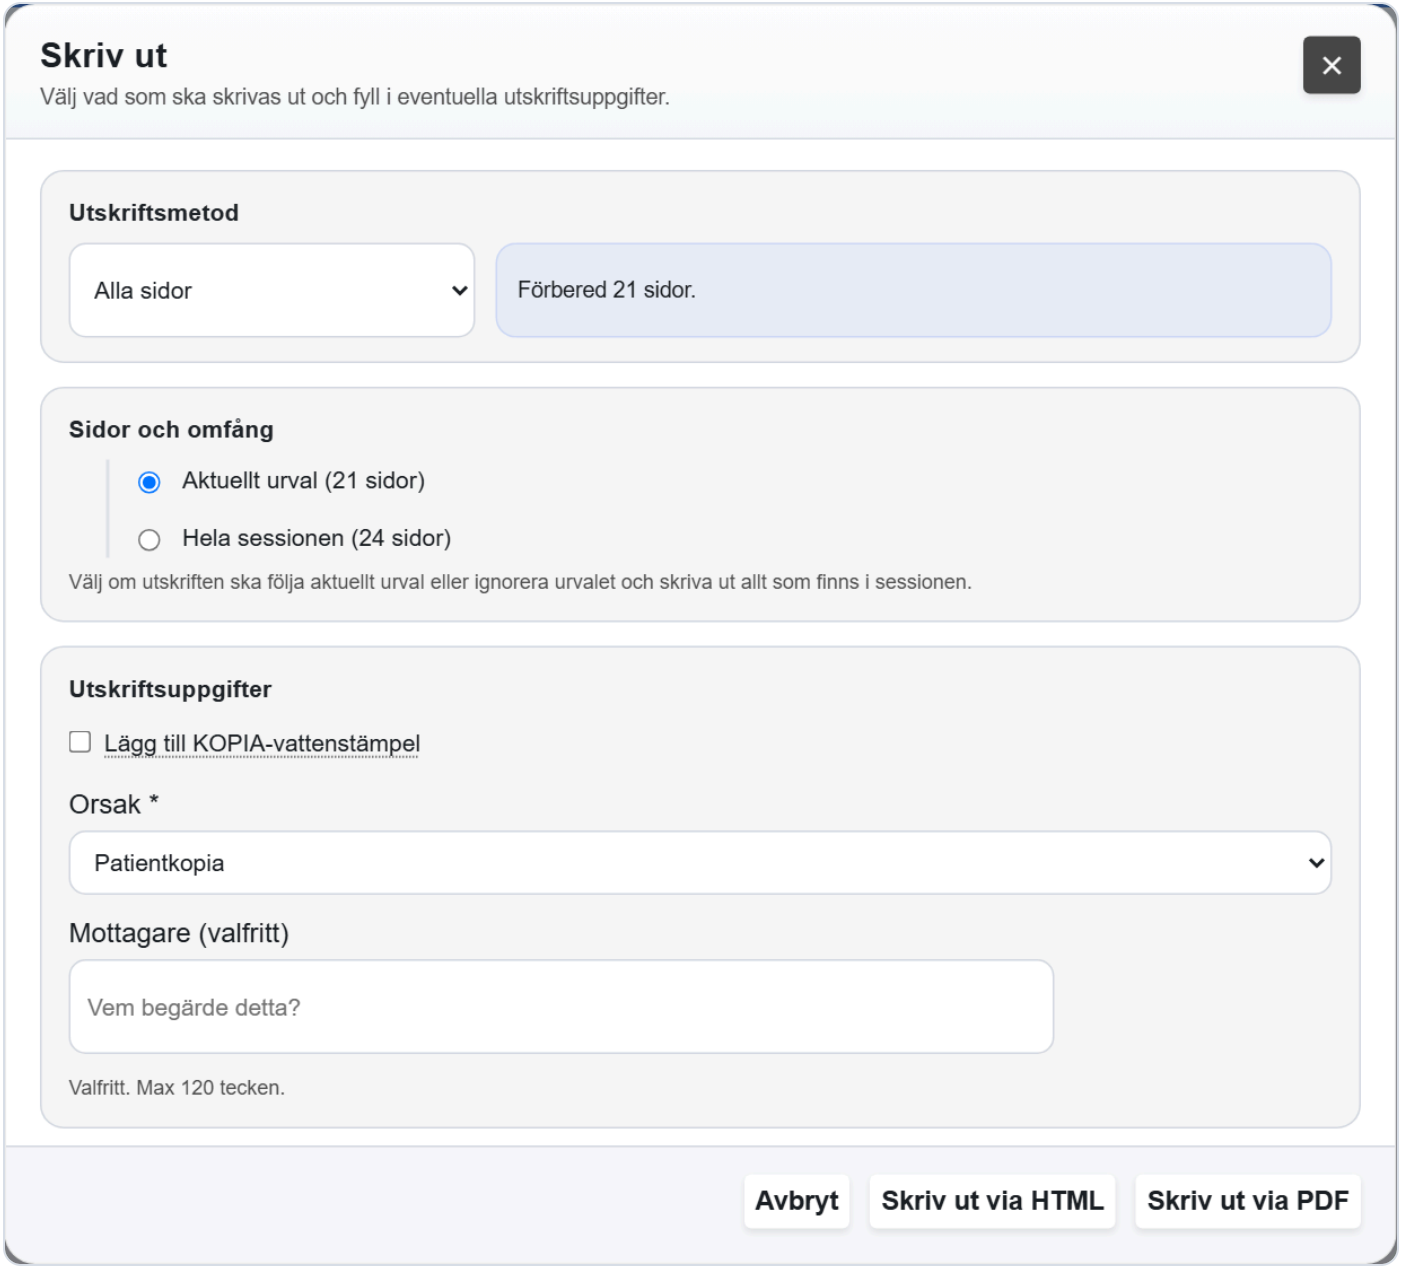

Active selection. The page box shows *1 / 21*, the selection button is red, the pane shows only the pages in the selection, and the red button at the top right of the pane removes the selection.

Tip: if you hide the page you are looking at, ODV jumps to the nearest page that is still shown.

8. Print the selection

1. Click the **print button**, or press `Ctrl` + `P` – normally that opens ODV's print dialog.
2. Choose **All pages** under *Print method*.
3. Check under *Pages and scope* that **Current selection** is chosen (it is preselected), so that only the pages in the selection are printed, in the selection's order. If you want everything, choose **Entire session** instead.

4 Fill in the print details and start printing as usual. How that works is described in Print in the Getting started guide.

All pages with a selection. Under *Pages and scope*, *Current selection (21 pages)* is preselected. *Entire session (24 pages)* includes everything.

The *Simple range* and *Custom pages* options are not available while a selection is active – the selection then decides what is printed. The pages are printed as they are in the archive: rotation, brightness and contrast are only included when you print with the *Active page* print method.

9. Remove the selection

Quickest: click the red button at the top of the thumbnail pane (*Clear the selection filter and show all pages*). All pages are shown again in their original order.

From the workspace: click **Add all** (*»*), then **Save** and **Leave**. All pages are included again. The selection is only removed if the pages are also in their original order. If you have changed the order, use the red button in the thumbnail pane instead.

The red button. It sits at the far right of the pane's button row and is only there while a selection is active.

If you have hidden every page, for example by hiding the last document, ODV shows the text *No pages remain in the current selection* instead of the page. Click **Show all pages** there.

Short checklist for selection

- ✓ A green *Save* button in the workspace means you have unsaved changes.
- ✓ A red selection button in the toolbar means a selection is active: pages are hidden or in a different order.
- ✓ The order in the right panel is the order in ODV and on the printout.

- ✓ *Current selection* prints what you chose, *Entire session* prints everything.
- ✓ The red button in the thumbnail pane removes the selection.
